

XCUITest Quick Reference

⌚ Test Lifecycle	💻 App Control	🔍 Element Queries																																
<table border="1"> <thead> <tr> <th>Method</th><th>Description</th></tr> </thead> <tbody> <tr> <td><code>setUp()</code></td><td>Prepare app state before each test</td></tr> <tr> <td><code>tearDown()</code></td><td>Clean up after each test</td></tr> <tr> <td><code>measure(_ block: () -> Void)</code></td><td>Benchmark performance blocks</td></tr> </tbody> </table>	Method	Description	<code>setUp()</code>	Prepare app state before each test	<code>tearDown()</code>	Clean up after each test	<code>measure(_ block: () -> Void)</code>	Benchmark performance blocks	<table border="1"> <thead> <tr> <th>Method</th><th>Description</th></tr> </thead> <tbody> <tr> <td><code>XCUIApplication()</code></td><td>Main handle for the app under test</td></tr> <tr> <td><code>app.launch()</code></td><td>Launch the app</td></tr> <tr> <td><code>app.launchArguments/launchEnvironment</code></td><td>Configure arguments or environment variables</td></tr> <tr> <td><code>app.terminate()</code></td><td>Terminate the app</td></tr> <tr> <td><code>app.activate()</code></td><td>Bring app to foreground</td></tr> </tbody> </table>	Method	Description	<code>XCUIApplication()</code>	Main handle for the app under test	<code>app.launch()</code>	Launch the app	<code>app.launchArguments/launchEnvironment</code>	Configure arguments or environment variables	<code>app.terminate()</code>	Terminate the app	<code>app.activate()</code>	Bring app to foreground	<table border="1"> <thead> <tr> <th>Method</th><th>Description</th></tr> </thead> <tbody> <tr> <td><code>app.buttons["identifier"]</code></td><td>Access button by accessibility identifier</td></tr> <tr> <td><code>app.staticTexts["label"]</code></td><td>Access static text by label</td></tr> <tr> <td><code>app.descendants(matching: .any)</code></td><td>General-purpose query for any element</td></tr> <tr> <td><code>query.firstMatch</code></td><td>Pick the first matching element</td></tr> <tr> <td><code>element(boundBy: index)</code></td><td>Select element at given index</td></tr> </tbody> </table>	Method	Description	<code>app.buttons["identifier"]</code>	Access button by accessibility identifier	<code>app.staticTexts["label"]</code>	Access static text by label	<code>app.descendants(matching: .any)</code>	General-purpose query for any element	<code>query.firstMatch</code>	Pick the first matching element	<code>element(boundBy: index)</code>	Select element at given index
Method	Description																																	
<code>setUp()</code>	Prepare app state before each test																																	
<code>tearDown()</code>	Clean up after each test																																	
<code>measure(_ block: () -> Void)</code>	Benchmark performance blocks																																	
Method	Description																																	
<code>XCUIApplication()</code>	Main handle for the app under test																																	
<code>app.launch()</code>	Launch the app																																	
<code>app.launchArguments/launchEnvironment</code>	Configure arguments or environment variables																																	
<code>app.terminate()</code>	Terminate the app																																	
<code>app.activate()</code>	Bring app to foreground																																	
Method	Description																																	
<code>app.buttons["identifier"]</code>	Access button by accessibility identifier																																	
<code>app.staticTexts["label"]</code>	Access static text by label																																	
<code>app.descendants(matching: .any)</code>	General-purpose query for any element																																	
<code>query.firstMatch</code>	Pick the first matching element																																	
<code>element(boundBy: index)</code>	Select element at given index																																	
👉 Basic Interactions	👉 Advanced Gestures	⌛ Waiting & Expectations																																
<table border="1"> <thead> <tr> <th>Method</th><th>Description</th></tr> </thead> <tbody> <tr> <td><code>tap() / doubleTap()</code></td><td>Single or double tap gesture</td></tr> <tr> <td><code>press(forDuration:)</code></td><td>Long-press gesture</td></tr> <tr> <td><code>typeText(_ text: String)</code></td><td>Enter text into a field</td></tr> <tr> <td><code>clearText()</code></td><td>Clear existing text input</td></tr> <tr> <td><code>swipeUp/Down/Left/Right()</code></td><td>Swipe gestures in any direction</td></tr> </tbody> </table>	Method	Description	<code>tap() / doubleTap()</code>	Single or double tap gesture	<code>press(forDuration:)</code>	Long-press gesture	<code>typeText(_ text: String)</code>	Enter text into a field	<code>clearText()</code>	Clear existing text input	<code>swipeUp/Down/Left/Right()</code>	Swipe gestures in any direction	<table border="1"> <thead> <tr> <th>Method</th><th>Description</th></tr> </thead> <tbody> <tr> <td><code>pinch(withScale:velocity:)</code></td><td>Pinch in/out gesture</td></tr> <tr> <td><code>rotate(_ rotation: CGFloat, velocity: CGFloat)</code></td><td>Two-finger rotation gesture</td></tr> <tr> <td><code>press(forDuration: thenDragTo: element)</code></td><td>Drag and drop interaction</td></tr> </tbody> </table>	Method	Description	<code>pinch(withScale:velocity:)</code>	Pinch in/out gesture	<code>rotate(_ rotation: CGFloat, velocity: CGFloat)</code>	Two-finger rotation gesture	<code>press(forDuration: thenDragTo: element)</code>	Drag and drop interaction	<table border="1"> <thead> <tr> <th>Method</th><th>Description</th></tr> </thead> <tbody> <tr> <td><code>expectation(for:predicate, evaluatedWith:element)</code></td><td>Define a test expectation</td></tr> <tr> <td><code>waitForExpectations(timeout:)</code></td><td>Wait for expectations to be fulfilled</td></tr> <tr> <td><code>element.waitForExistence(timeout:)</code></td><td>Polling-based wait for element existence</td></tr> <tr> <td><code>NSPredicate</code></td><td>Build custom conditions for expectations</td></tr> </tbody> </table>	Method	Description	<code>expectation(for:predicate, evaluatedWith:element)</code>	Define a test expectation	<code>waitForExpectations(timeout:)</code>	Wait for expectations to be fulfilled	<code>element.waitForExistence(timeout:)</code>	Polling-based wait for element existence	<code>NSPredicate</code>	Build custom conditions for expectations		
Method	Description																																	
<code>tap() / doubleTap()</code>	Single or double tap gesture																																	
<code>press(forDuration:)</code>	Long-press gesture																																	
<code>typeText(_ text: String)</code>	Enter text into a field																																	
<code>clearText()</code>	Clear existing text input																																	
<code>swipeUp/Down/Left/Right()</code>	Swipe gestures in any direction																																	
Method	Description																																	
<code>pinch(withScale:velocity:)</code>	Pinch in/out gesture																																	
<code>rotate(_ rotation: CGFloat, velocity: CGFloat)</code>	Two-finger rotation gesture																																	
<code>press(forDuration: thenDragTo: element)</code>	Drag and drop interaction																																	
Method	Description																																	
<code>expectation(for:predicate, evaluatedWith:element)</code>	Define a test expectation																																	
<code>waitForExpectations(timeout:)</code>	Wait for expectations to be fulfilled																																	
<code>element.waitForExistence(timeout:)</code>	Polling-based wait for element existence																																	
<code>NSPredicate</code>	Build custom conditions for expectations																																	
✅ Assertions	📱 Device & System	🧰 Utilities & Helpers																																
<table border="1"> <thead> <tr> <th>Method</th><th>Description</th></tr> </thead> <tbody> <tr> <td><code>XCTAssertTrue/False(_ expression)</code></td><td>Verify a boolean condition</td></tr> <tr> <td><code>XCTAssertEqual(_:, _:)</code></td><td>Verify equality of values</td></tr> <tr> <td><code>XCTAssertGreaterThanOrEqual(_:, _:)</code></td><td>Verify one value is greater than another</td></tr> </tbody> </table>	Method	Description	<code>XCTAssertTrue/False(_ expression)</code>	Verify a boolean condition	<code>XCTAssertEqual(_:, _:)</code>	Verify equality of values	<code>XCTAssertGreaterThanOrEqual(_:, _:)</code>	Verify one value is greater than another	<table border="1"> <thead> <tr> <th>Method</th><th>Description</th></tr> </thead> <tbody> <tr> <td><code>XCUIDevice.shared.orientation</code></td><td>Set the simulated device orientation</td></tr> <tr> <td><code>XCUIDevice.shared.press(.home/.lock)</code></td><td>Simulate hardware button press</td></tr> <tr> <td><code>addUIInterruptionMonitor(withDescription:handler:)</code></td><td>Handle system alerts</td></tr> </tbody> </table>	Method	Description	<code>XCUIDevice.shared.orientation</code>	Set the simulated device orientation	<code>XCUIDevice.shared.press(.home/.lock)</code>	Simulate hardware button press	<code>addUIInterruptionMonitor(withDescription:handler:)</code>	Handle system alerts	<table border="1"> <thead> <tr> <th>Method</th><th>Description</th></tr> </thead> <tbody> <tr> <td><code>SpringBoard app</code></td><td>Interact with the SpringBoard for system dialogs</td></tr> <tr> <td><code>Custom extensions</code></td><td>E.g., <code>clearAndType(text:)</code> convenience methods</td></tr> <tr> <td><code>Page Objects</code></td><td>Wrap common workflows into reusable classes</td></tr> </tbody> </table>	Method	Description	<code>SpringBoard app</code>	Interact with the SpringBoard for system dialogs	<code>Custom extensions</code>	E.g., <code>clearAndType(text:)</code> convenience methods	<code>Page Objects</code>	Wrap common workflows into reusable classes								
Method	Description																																	
<code>XCTAssertTrue/False(_ expression)</code>	Verify a boolean condition																																	
<code>XCTAssertEqual(_:, _:)</code>	Verify equality of values																																	
<code>XCTAssertGreaterThanOrEqual(_:, _:)</code>	Verify one value is greater than another																																	
Method	Description																																	
<code>XCUIDevice.shared.orientation</code>	Set the simulated device orientation																																	
<code>XCUIDevice.shared.press(.home/.lock)</code>	Simulate hardware button press																																	
<code>addUIInterruptionMonitor(withDescription:handler:)</code>	Handle system alerts																																	
Method	Description																																	
<code>SpringBoard app</code>	Interact with the SpringBoard for system dialogs																																	
<code>Custom extensions</code>	E.g., <code>clearAndType(text:)</code> convenience methods																																	
<code>Page Objects</code>	Wrap common workflows into reusable classes
